

ubuntu_setup

Setting up Ubuntu Server inside VirtualBox

What you need beforehand

- Oracle VirtualBox installed on your Windows PC
- An Ubuntu Server ISO image (e.g., ubuntu-22.04-live-server-amd64.iso)

Step-by-step VM creation

- In VirtualBox, click **New**. Give the VM a name (e.g., "UbuntuServer"), type **Linux**, version **Ubuntu (64-bit)**

- Assign at least **4 GB RAM** and a **30 GB virtual disk**

- Go to VM **Settings** → **Storage**. Attach the Ubuntu ISO to the optical drive.

- Start the VM. It will boot from the ISO.
- Choose your language, then select **Install Ubuntu Server**
- Network configuration:** Leave the default DHCP (NAT). Press **Done**
- Proxy:** Leave blank → **Done**
- Mirror:** Use the default <http://archive.ubuntu.com/ubuntu> → **Done**
- Storage:** Choose "Use an entire disk". LVM is optional. → **Done**.

- Confirm the storage summary → **Done**
- Profile setup:** Enter your full name, server name, username, and a strong password. **Write these down**

- **SSH setup:** Mark **"Install OpenSSH server"** (this is important for PuTTY).
→ **Done**
- **Snaps:** Leave everything unchecked → **Done**
- Wait for the installation to finish. When prompted, reboot

```

```

Important: Remember the username and password you chose in step 11 – you will need them for SSH and WinSCP.

First boot and finding the IP address

Log in to the VM using the username and password you just created.

To see the VM's IP address, run:

```
ip addr
```

Look for an interface named enp0s3 or eth0. Its inet address is the IP you will use to connect from Windows.

- **NAT mode (default)** – IP is usually 10.0.2.15.

- **Bridged mode** (recommended for easier access) – IP will be on your local network, e.g., 192.168.1.x.

Switching to Bridged mode (optional but helpful)

1. Shut down the VM: `sudo shutdown now`
2. In VirtualBox, go to **VM Settings** → **Network** → **Adapter 1**.
3. Change "Attached to" from **NAT** to **Bridged Adapter**.

Start the VM and run `ip a` again to get the new IP address
